Historical Relationship Between the Minimum Wage and Poverty, 1959 to 2005

Abstract

This memorandum is in response to your request about the historical relationship between the federal minimum wage and poverty from 1959 to 2005. In particular, you were interested in the annual income a full-time, full-year worker earning the minimum wage would earn relative to the poverty level for a family of three.

Keywords

minimum wage, poverty, federal, population, wage, family, full- time, full-year, census bureau

SUBJECT: Historical Relationship Between the Minimum Wage and Poverty, 1959 to 2005

This memorandum is in response to your request about the historical relationship between the federal minimum wage and poverty from 1959 to 2005. In particular, you were interested in the annual income a full-time, full-year worker earning the minimum wage would earn relative to the poverty level for a family of three.

Table 1 shows the effective annual minimum wage from 1959 through 2005 for a full-time full-year worker, relative to the poverty level for a three-person family. The table shows when statutory changes to the federal minimum wage became effective. Average effective minimum wage rates for the year were calculated based on the pro-rated average of effective wage rates over the course of the year. For example, in 1997, the minimum wage was \$4.75 per hour for the first eight months of the year (January through August), and \$5.15 per hour for the last four months of the year (September through December). The average effective minimum wage for the year is thus: $((\$4.75 \times 8) + (\$5.15 \times 4))/12$, or \$4.8833 per hour. Here, full-time full-year work is assumed to amount to 2,080 hours of work per year (40 hours per week x 52 weeks).

The poverty income level used here is the U.S. Census Bureau's average weighted poverty thresholds for a family of three. The earliest year for which official Census Bureau poverty income thresholds are available is 1959. Census Bureau poverty thresholds vary by family size and composition (e.g., the poverty threshold for a family of three differs by the number of children in the family). The *average weighted thresholds* reflect the average of the individual thresholds for a given family size by the observed distribution of families of varying composition in the population, as measured by the Census Bureau's Current Population Survey (CPS). Each year the Census Bureau updates the individual poverty thresholds to reflect changes in prices, and the average weighted thresholds, to reflect changes in the composition of the population for families of each size. The estimate for 2004 is based on the Census Bureau's preliminary average weighted poverty thresholds, which reflect price changes for 2004, but reflect the population weighting from 2003, as opposed to 2004. The final average weighted poverty thresholds for 2004, scheduled for release this

fall, may differ by a few dollars from those shown here.¹ The projected poverty thresholds for 2005 are based on the 2004 preliminary weighted poverty thresholds adjusted for average price inflation from January 2005 to May 2005, compared to the same period in 2004, which amounted to a 3.1% increase in the projected 2005 poverty thresholds, compared to the 2004 preliminary poverty thresholds. The Census Bureau will issue preliminary poverty thresholds for 2005 in January 2006, when price changes for the 2005 calendar year will be available. Final weighted poverty thresholds for 2005 won't be available until the fall of 2006.

Figure 1 depicts the basic trends shown in the table. **Table 1** and **Figure 1** show that the federal minimum wage was highest relative to poverty in 1968, when it amounted to 118.7% of poverty for a full-time full-year worker supporting three people. Since 1980, the minimum wage has been below the poverty line for a full-time full-year worker supporting a family of three. The most recent increase to the federal minimum wage to \$5.15 per hour in September 1997 (from \$4.75 per hour) brought full-time full-year minimum wage earnings for a family of three up to 82.4% of poverty. Since then, the nominal minimum wage of \$5.15 per hour has eroded relative to the poverty level, which is adjusted each year for changes in prices. In 2005, full-time full-year earnings for a minimum wage worker amounts to \$10,712, or 68.9% of the estimated projected poverty level for a family of three (\$15,536). Based on the assumptions used, it is projected that the level of the minimum wage relative to poverty in 2005 will be at the lowest level seen at any time over the past 47 years.

^b Effective wage, prorated for the year. For example, in 1997, the minimum wage was \$4.75 per hour for the first eight months of the year (January through August), and \$5.15 per hour for the last four months of the year (September through December). The average effective minimum wage for the year is thus: $((\$4.75 \times 8) + (\$5.15 \times 4))/12$, or \$4.8833 per hour.

^c U.S. Census Bureau weighted average poverty thresholds for a family of three. Historical tables at: <http://www.census.gov/hhes/www/poverty/histpov/hstpov1.html>.

^d Weighted annual average poverty threshold for a family of three is a preliminary estimate from U.S. Census Bureau: (<http://www.census.gov/hhes/www/poverty/threshld/04prelim.html>) accessed on June 29, 2005. Final published weighted average poverty thresholds may differ by a few dollars, when published in the fall of 2005.

^e Projected 2005 poverty threshold based on 2004 preliminary estimated poverty threshold inflated to 2005 by the average increase in the CPI-U from January to May 2005, compared to January to May 2004.
