Who Participated in School-to-Work Programs in 1998? Technical Report

Abstract

[Excerpt] This report is based on a survey of 7425 students attending high school during the 1998/99 academic year that asked about recent participation in school-to-work (STW) activities. The survey is the first wave of the National Longitudinal Survey of Youth begun in early 1997 (NLSY97). Ninety-three percent of the youth surveyed in the initial wave were interviewed in the second follow up that we are analyzing here. The statistics reported below are based on weighted data and so represent the population of 15 to 19 year olds attending school during the 1998/99 academic year. Youth who graduated from or dropped out of high school before fall 1998 were not asked questions about participation in school-to-work programs and so are not included in our analysis.

Abstract

This report was prepared for the National School to Work Office pursuant to Task Order #30--Analysis of National Longitudinal Survey of Youth 1997 Data: Participants in School-to-Work Activities. The Project Officer was Sharon Belli. The findings and opinions expressed in this report do not reflect the position or policies of the School to Work Office or of the U.S. Department of Education.

Who Participated in School-to-Work Programs in 1998? Technical Report

All Students (9th Graders and Older)

Introduction

This report is based on a survey of 7425 students attending high school during the 1998/99 academic year that asked about recent participation in school-to-work (STW) activities. The survey is the first wave of the National Longitudinal Survey of Youth begun in early 1997 (NLSY97). Ninety-three percent of the youth surveyed in the initial wave were interviewed in the second follow up that we are analyzing here. The statistics reported below are based on weighted data and so represent the population of 15 to 19 year olds attending school during the 1998/99 academic year. Youth who graduated from or dropped out of high school before fall 1998 were not asked questions about participation in school-to-work programs and so are not included in our analysis.

The initial wave of the NLSY97 survey asked 15 and 16 year olds whether they had ever participated in one of seven different types of school-to-work (STW) activities. Since middle school and even primary school students participate in STW activities such as job shadowing, mentoring, school-based enterprises and introductory vocational courses, the responses to these questions often described activities that occurred many years earlier. From that survey we calculated that the “ever participated” rate was 19 percent for ‘career major,’ 12 percent for ‘job shadowing,’ 5 percent for mentoring, 9.3 percent for cooperative education, 9 percent for school-based enterprises, 8 percent for ‘tech prep,’ and 5 percent for apprenticeships or internships. Cumulating across all types of STW programs, we found that 43 percent of students had been involved in one-or more STW activities at some time in the past and 12 percent had visited a work site as part of that program.

The field period for the first follow up interviews was from October 1998 to April 1999. High school students were asked about their participation in specific STW activities since the

time of their baseline interview in 1997. Almost all baseline interviews were conducted between February and October of 1997, so STW participation rates refer to a period of varying length (averaging 20 months) that spans two years of school attendance. Rates of 'recent participation' calculated from the first follow-up survey were 17.6 percent for "career major", 11 percent for job shadowing, 4.9 percent for mentoring, 6.6 percent for coop education, 5.5 percent for school-based enterprise, 6.4 percent for tech prep and 4.5 percent for apprenticeship. Overall 37 percent of students had recently participated in one or more STW activities and 9.7 percent visited a work site as part of a STW program.

Any School-to-Work Program Including Career Major

Thirty-seven percent of high school students interviewed in 1998/99 said they had participated in one or more School-to-Work program or activity in the previous 20 months.

How do these students differ from students who do not participate? The first column of Tables 1A through 3A presents data on students who did not participate in any STW programs. The third column of these tables presents data on the students who have participated in one or more school-to-work programs. If there are no stars (*, **, or ***) after a number in column 3, the numbers in column 1 and 3 are not significantly different from each other. The number of stars indicates how significant the difference is. Three stars (***) indicates the highest significance [if there was in fact no difference between the two population groups, the difference found in this sample's data will be found less than 1 percent of the time]. Two stars (**) indicates there is a less than 5 percent chance of erroneously concluding there is a difference between the groups when the truth is that no difference exists. One star indicates that the chance of such an error is less than 10 percent. Our discussion of the results will reference statistically significant differences only. When differences are significant but small and substantively unimportant we will refer to the difference as 'slight.'

Family Background is similar

In most respects the family background of students who recently participated in one or more of STW activity is similar to the background of those not participating. Average family income, receipt of welfare, percent foreign born and percent from single parent families, for example, were the same. Of 26 comparisons only 12 resulted in significant differences and most of those were of no substantive significance. What were the differences? Compared to those who do not participate, those who participate in School-to-Work programs:

- Have parents who were slightly more likely to have graduated from high school but slightly less likely to have graduated from college.
- Participants were more likely to be African-American and less likely to be Hispanic or Asian.
- Participants were slightly more likely to be Catholic and slightly less likely to be Baptist or Pentecostal Protestants.

Type of school

- School-to-Work participants were much more likely to attend vocational high schools and less likely to attend Catholic high schools and other private high schools.
- Participants were more numerous at large high schools
- Participation rates were lower at schools with very high or very low pupil-teacher ratios.

Neighborhoods

- Participants were much more likely to live in unsafe neighborhoods. A higher proportion reported having had their house broken-into and having seen someone shot before they were 12 years old. Gangs were more prevalent.
- Participants were slightly less likely to live in a suburb.

School Environment

- Students participating in school-to-work programs were much more likely to live in unsafe neighborhoods. A larger percentage of their peers at school were reported to be cutting classes and slightly fewer were reported to be planning to go to college. They were considerably more likely to have been victims of repeated bullying when they were young.
- STW participants were more likely to report that cheating on tests and assignments and

student discipline were problems at their school.

- They were nevertheless equally likely to report that they felt safe at school.

Course Taking patterns were simultaneously more vocational and more academic.

Of the 11 comparisons made, 10 resulted in significant differences.

- Participants were much less likely to describe themselves as being in the general track and more likely to describe themselves as pursuing a vocational or college prep program.
- Participants were more likely to have taken algebra, geometry and lab science courses during the last 20 months.
- They were more likely to have taken shop and industrial arts classes, home economics classes and all kind of computer courses (Computer literacy, word processing, computer programming and others).

School Attitudes, Behavior and Achievement

- STW participants were equally likely to report that teachers were 'good' and that teachers were 'interesting.'
- They were less likely to feel that teachers were grading students fairly.
- They were more likely to believe they were in control of their fate.
- They were no different in absenteeism, rates of unexcused tardiness, hours spent doing homework and reading for pleasure and the likelihood of taking SAT or ACT tests.
- They did, however, have slightly lower math test scores and GPAs and lower scores on college admissions tests. They were slightly less likely to believe that they will graduate from college before age 30.

Employment

- They were much more likely to have worked for pay. Hours worked per year were 47 to 80 percent higher.
- Job satisfaction and wage rates were no different. They were slightly more likely to have worked in a sales job but otherwise the occupations were no different.

Different school-to-work programs recruit students from different backgrounds.

Participants in career major and tech prep programs, for example, tended to come from lower income backgrounds, while those who spent time shadowing someone at work were from higher income backgrounds. Thus, the findings for participation in one or more STW program just

presented cannot be extrapolated to each individual STW program. Consequently, we present below an analysis of the characteristics of participants for each STW program.

1. Career Major programs

The NLS-97 surveys defined Career Major as ‘a sequence of courses based on an occupational goal.’ In the survey of schools attended by NLS-97 students, only 20 percent of the principals said their school offered career majors (Visser et al 1998). Students, however, adopted a more inclusive definition of ‘career major’ for a remarkably high 17.6 percent of high school students reported having been in career major programs in the previous 20 months. Apparently, as students define it, “career major” is a more inclusive less focused program than the one most STW professionals have in mind when they use the term.ⁱ Many more students report having participated in a career major program than any other kind of STW activity.

How do these ‘career major’ [broadly defined] students compare to other students? The fourth column of Tables 1A through 3A presents data on the characteristics of students who have participated in career major programs. When compared with other students, students say they are in a Career Major program...

Come from less well off families who were more likely to have received government transfers at some time in the past. They were less likely to be college educated and more likely to come from a single parent family. They were more likely to be African-American and less likely to be White, Asian and Hispanic. They were more likely to be members of a Baptist or Pentecostal Church and less likely to be Jewish. Their home-risk and environmental risk scales were higher.

They were more likely to live in a central city and less likely to live in a suburb. They were more likely to be attending a vocational high school and less likely to be attending private high schools. Participation rates were lower at small schools and at schools with very high or very low pupil-teacher ratios.

They were more likely to live in unsafe neighborhoods. They were more likely to report gangs in the neighborhood, having had their house broken into and having seen someone shot before reaching age 12. They were also more likely to have been repeatedly bullied

when they were young. Their peers were less likely to plan to attend college, more likely to cut classes and more likely to cheat on tests and assignments.

Students who took part in Career Major programs were much less likely to describe themselves as being in the general track and more likely to describe themselves as pursuing a vocational or college prep program. Participants were more likely to have taken algebra, geometry and lab science courses during the last 20 months. They were much more likely to have taken computer, shop/industrial arts and home economics courses.

They were less likely to feel that teachers were interesting, more likely to feel that grading was unfair and more likely to be late to school. They had lower math test scores, lower GPAs and lower scores on college admissions tests. They were slightly less likely to believe that they will graduate from college before age 30.

They were much more likely to have worked for pay. Hours worked per year were 47 to 80 percent higher. Job satisfaction and wage rates were no different. They were slightly more likely to have worked in a sales job but otherwise the occupations were no different.

2. Visiting Work Sites as part of a STW program

According to the NLS-97 school survey, 84 percent of schools offer one or more kinds of work-based learning opportunities (Visher et al 1998). The student survey found that 9.7 percent of students have visited or worked at a work site as part of a STW program during the previous 20 months.

The fifth column of Tables 1A through 3A presents data on the characteristics of students who have visited work sites as part of a STW program. When compared with other students, the students who visited work sites:

Were less likely to have foreign-born parents, less likely to be Asian and were more likely to be a non-Baptist Protestant. They were more likely to attend a large high school. They less frequently reside outside metropolitan areas and tend to live in unsafe neighborhoods.

They were more likely to report gangs in the neighborhood and having seen someone shot before reaching age 12. They were also more likely to have been repeatedly bullied when they were young. Their peers were less likely to plan to attend college, more likely to cut

classes and more likely to cheat on tests and assignments. They were more likely to say discipline is a problem at their school.

Students who visited work sites were much less likely to describe themselves as being in the general track and more likely to be pursuing a vocational or college prep program. Participants were more likely to have taken algebra, geometry and lab science courses during the last 20 months. They were also more likely to have taken computer, shop/industrial arts and home economics courses.

Students who spent time at work sites were more likely to feel that grading and discipline at their school is unfair and that teachers were uninteresting. They had the same GPA but lower math test scores. They were less likely to have taken SAT and ACT tests and less likely to expect to graduate from college.

These students have more employment experience; working on average 50 to 89 percent more than students who did not visit work sites.

3. Job Shadowing

According to the NLS97 school survey, 43 percent of high schools offer students opportunities to shadow workers at their job sites (Visher et al 1998). Eleven percent of high school students in 1998 reported they shadowed a worker in the previous 20 months. The first column of Tables 1B through 3B presents data on the characteristics of students who have participated in job shadowing. The number of stars (*, **, or ***) after each number indicates whether the incidence (or value) of this trait for those participating in job shadowing is significantly different from its incidence for those who have not participated in job shadow programs. Students who have done Job Shadowing:

Are more likely to be from intact two-parent high-income families who have never received welfare. Their parents tend to have above average levels of education and risk factors associated with the home were significantly below average. Their parents were also less likely to be foreign-born and less likely to be Hispanic or Asian.

They were more likely to attend a vocational high school and less likely to attend a Catholic or other private high school.

Students who recently participated in a Job Shadow program were less likely to be in the general track and more likely to be in a vocational program. Participants were more likely to have taken computer, shop/industrial arts and home economics courses at some time in their career and more likely to have taken mathematics and lab science courses during the previous 20 months. They watch less TV but in other respect their attitudes toward school and their behavior in school was no different. They were more likely to be female and had higher grade point average and higher math test scores.

They were much more likely to have worked for pay. Hours worked per year were 42 percent higher. Job satisfaction and wage rates were no different.

4. Mentoring programs

For purposes of this study mentoring was defined as “being matched with an individual in an occupation.” According to the NLS97 school survey, 25 percent of high schools offer students opportunities to be mentored (Visher et al 1998). About 4.85 percent of students said they had participated in a mentoring program through their school during the previous 20 months. While the question asks about mentoring arrangements brokered by the school, it is quite possible that mentoring experiences arranged by other community organizations were also included in the students’ responses.

The second column of Tables 1B through 3B presents data on the characteristics of students who have been mentored. Students who participated in Mentoring programs were...

More likely to be African-American and less likely to be Catholic, White or Asian. They were more likely to live in a central city. Parent’s education, family income and family structure were no different, but their neighborhood appeared to be less safe. They were more likely to report gangs in their neighborhood and to have seen someone shot when they were young.

They were more likely to be attending large high schools and schools with a vocational specialty. School environment tended to be more problematic. Mentored students were more likely to report that class cutting, cheating on tests and assignments and student discipline were problems at their school and that they did not feel safe at school. They were also more likely to have been bullied when they were young. They were less likely to

view their teachers as interesting but just as likely to think their teachers were 'fair graders' and 'good' overall.

Students who have been mentored were much less likely to describe themselves as being in the general track and more likely to describe themselves as pursuing a vocational or a college prep program. They were more likely to have taken algebra, geometry and lab science courses during the last 20 months. They were also much more likely to have taken computer, shop/industrial arts and home economics courses. They spent more time reading for fun and were less likely to be late for school. With respect to absenteeism, grades, test scores and time spent on homework, however, they were no different from other students.

They were much more likely to have worked for pay. Hours worked per year were 46 percent higher. Job satisfaction and wage rates were no different.

5. Cooperative Education Programs

In cooperative education students take part-time jobs that were related to their vocational and academic studies at school. Participants in cooperative education were typically juniors or seniors. According to the NLS97 school survey, 48 percent of high schools offer opportunities to participate in a cooperative education program (Visher et al 1998). A remarkably high 6.7 percent of high school students said they had participated in cooperative education in the previous 20 months. Some say they did not spend time at a job site as part of the program, so our respondents may be using a broader definition of 'cooperative education' than most STW professionals do.

The third column of Tables 1B through 3B presents data on the characteristics of students who report participating in cooperative education. Students who have recently participated in a Coop Education program...

Had less well-educated parents and were more likely to be African-American. Family structure and family incomes were, on the other hand, no different. They spend more time in family activities than students not involved in coop education. They were more likely to live in a small city or metropolitan area.

They were more likely to live in unsafe neighborhoods. They were more likely to report gangs in the neighborhood, having had their house broken into and having seen someone shot before reaching age 12. Their peers were less likely to plan to attend college, more likely to cut classes and more likely to cheat on tests and assignments. Discipline was more likely to be a problem at the school.

Students who took part in cooperative education programs were much less likely to describe themselves as being in the general track or a pure college prep track and more likely to describe themselves as pursuing a vocational program or a program combining vocational with college prep. Participants were more likely to have taken Algebra I and geometry and other introductory math courses. They were also much more likely to have taken math and science classes during the last 20 months. They were also much more likely to have taken computer, shop/industrial arts and home economics courses.

They were less likely to feel that teachers were interesting, more likely to feel that grading was unfair and more likely to be late to school. They had lower math test scores, lower GPAs and lower scores on college admissions tests. They were less likely to believe that they will graduate from college before age 30.

They have worked nearly twice as many hours since the age of 14. Job satisfaction and wage rates on these jobs were no different.

6. School-Sponsored Enterprises

School-sponsored enterprise was defined as “the production of goods or services by students for sale or use by others.” According to the NLS97 school survey, 19 percent of high schools offer students the opportunity to work in a School-Sponsored Enterprise (Visher et al 1998). In the 1998 survey of students, 5.5 percent said they participated in a school-sponsored enterprise in the past 20 months. Here again students were reporting a higher rate of participation in the program than probably many STW professionals would have expected.

The fourth column of Tables 1B through 3B presents data on the characteristics of students who have worked in a School-Sponsored Enterprise. Students who participated in a School-Sponsored Enterprise ...

Were slightly more likely to be African-American, more likely to be female and less likely to be Hispanic. They were more likely to be non-Baptist Protestants. The home-risk index developed by the National Opinion Research Corporation was lower for students working in school-sponsored enterprises. They were also more likely to do things as a family.

They were less likely to live in a small city or metropolitan area. In other respects, students working in school-sponsored enterprises live in neighborhoods that were much like the neighborhoods that other students live in.

They were more likely to attend vocational high schools and private high schools. They were more likely to report that their school had discipline problems and that their peers were not likely to go to college. But in other respects attitudes towards their school were no different.

Students who took part in School-Sponsored Enterprise programs were less likely to describe themselves as being in the general track and more likely to describe themselves as pursuing a vocational program or a program combining vocational with college prep. These students were more likely to have taken science, mathematics and computer courses in the previous 20 months. They were also more likely to have taken industrial arts and home economics courses.

Students who worked in a School-Sponsored Enterprise had higher grade point averages.

Unlike participants in other STW programs, students who work in school-sponsored enterprises were not more likely to have worked for pay.

7. Tech Prep

Tech Prep is defined as “a planned program of study with a defined career focus that links secondary and post-secondary education.” Fifty percent of high schools said they offer a Tech-Prep program (Visher et al 1998). About 6.4 percent of students said they participated in such a program in the past 20 months.

The fifth column of Tables 1B through 3B presents data on the characteristics of students who participated in Tech Prep. Students who participated in a Tech prep. program...

Came from families whose incomes are about 20 percent lower than the incomes of families whose children were not in a Tech-Prep program. Their families were about 8 percentage points more likely to have received government transfers at some time in the past. Their parents were less likely to be college educated. They were more likely to be African-American and less likely to be Asian. They were more likely to be members of a Baptist or Pentecostal Church and less likely to be Jewish, Catholic or from one of the other Protestant denominations. Their environmental risk scales were higher. The family spent less time together doing fun activities and educational enrichment materials and activities were less common.

They were more likely to live in a central city and less likely to live in a suburb. They were more likely to be attending a vocational high school and less likely to be attending private high schools. Participation rates were lower at small schools and at schools with very low pupil-teacher ratios.

They were more likely to live in unsafe neighborhoods. They were more likely to report gangs in the neighborhood and hearing gunshots in the neighborhood. They were also more likely to have been repeatedly bullied when they were young. Their peers were less likely to plan to attend college and more likely to cut classes. They are more likely to report discipline problems at their school and say they do not feel safe at school.

Students who took part in Tech-Prep programs were much less likely to describe themselves as being in the general track and much more likely to describe themselves as pursuing a vocational or college prep program. Forty-four percent said they were in a college prep program. Participants were more likely to have taken algebra, geometry and lab science courses during the last 20 months. They were also much more likely to have taken computer, shop/industrial arts and home economics courses.

They were less likely to feel that teachers were interesting, more likely to feel that grading was unfair and more likely to be absent or late in getting to school. They had lower GPAs and lower scores on college admissions tests. They were also less likely to have taken a college admissions test. They were considerably less likely to believe that they will graduate from college before age 30. They were less optimistic about their future and about their ability to control their fate.

They were much more likely to have worked for pay. Time in paid employment was 58 percent higher. Job satisfaction and wage rates were no different. They were slightly more likely to have worked in an operative or laborer jobs and slightly less likely to have worked in a managerial, technical or professional occupation since age 14.

8. Internships and Apprenticeships

Internships and apprenticeships were defined as “working for an employer to learn about a particular occupation or industry.” According to the NLS97 school survey, 25 percent of high schools offer internship opportunities and 20 percent offer apprenticeship opportunities (Visher et al 1998). About 4.5 percent of high school students report having interned or apprenticed with an employer in the past 20 months.

The sixth column of Tables 1B through 3B presents data on the characteristics of students who have had an internship or apprenticeship. Students who participated in an internship and apprenticeship programs...

Are from families with similar educational backgrounds, similar incomes and similar family structure to families of children who did not do an internship or apprenticeship. They were, in fact, slightly less likely to have received government transfers in the past. They were more likely to be Hispanic, more likely to be Jewish and less likely to be Catholic.

They were more likely to live in a small city or a large metropolitan area. They were less likely to be attending private high schools. Participation rates were lower at small schools and at schools with very high pupil-teacher ratios.

They were slightly more likely to live in unsafe neighborhoods. They were more likely to have seen someone shot before they were twelve. Their peers were less likely to plan to attend college, less likely to participate in extra-curricular activities and more likely to cut classes. They were more likely to report discipline problems at their school.

Students who did an internship or apprenticeship were much less likely to describe themselves as being in the general track and much more likely to describe themselves as pursuing a vocational program. Forty percent said they were in a college prep program. Participants were more likely to have taken algebra, geometry and lab science courses during the last 20 months. They were also much more likely to have taken computer, shop/industrial arts and home economics courses.

They were more likely to feel that grading was unfair and had lower math test scores. They spent above average amounts of time doing homework and reading for pleasure at home. Their GPAs were average and scores on college admissions tests were only slightly lower. Their expectations about completing college were no different but they were more likely to have taken a college admissions test.

They were much more likely to have worked for pay. Time in paid employment was double that of other students. Job satisfaction and wage rates were significantly higher. They were more likely to have worked in a clerical, craft, operative or laborer jobs in the past.

Table 1-A
Family Characteristics of Students
in School-to-Work Programs in 1997 or 1998

	Did not Participate in School-to-Work		Any School-to- Work	Career Major	Time at Work Site

Appendix

ⁱ STW Progress Measures provides data on numbers of students participating in various kinds of STW activities at the 7982 high schools that were part of STW partnerships. They estimate that in 1997 these schools had one million secondary school students in classes with a career-related curriculum.
