Private Health Insurance Premiums and Rate Reviews

Abstract

[Excerpt] In general, the premiums charged by health insurance companies represent actuarial estimates of the amount that would be required to cover three main components: (1) the expected cost of the health benefits covered under the plan, (2) the business administrative costs of operating the plan, and (3) a profit. The final premium calculation often is adjusted upward or downward to reflect several factors, such as making up for a previous financial loss.

Health insurance premiums have been trending up, while the value of coverage has trended down. Available data indicate that both administrative and medical costs continue to rise, but the rate of growth in these expenses slowed between 2008 and 2009. The data also suggest that the rise in medical costs is primarily attributable to the price of services, not increased utilization.

The rise in the cost of health insurance has received considerable attention by Congress and resulted in calls for more regulation. The regulation of private health insurance has traditionally been under the jurisdiction of the states. Most states have used their regulatory authority over the business of insurance to require the filing of health insurance documents containing rate information for one or more insurance market segments or plan types. With the enactment of the Patient Protection and Affordable Care Act (P.L. 111-148, PPACA) on March 23, 2010, and subsequent amendments, the federal government will assume a role in private health insurance rate reviews by providing grants to states and requiring health insurance companies to provide justifications for proposed rate increases determined to be unreasonable.

This report provides an overview of the concepts, regulation, and available public data regarding private health insurance premiums. This report will be updated to reflect relevant legislative activity and the availability of new public data.

Summary

In general, the premiums charged by health insurance companies represent actuarial estimates of the amount that would be required to cover three main components: (1) the expected cost of the health benefits covered under the plan, (2) the business administrative costs of operating the plan, and (3) a profit. The final premium calculation often is adjusted upward or downward to reflect several factors, such as making up for a previous financial loss.

Health insurance premiums have been trending up, while the value of coverage has trended down. Available data indicate that both administrative and medical costs continue to rise, but the rate of growth in these expenses slowed between 2008 and 2009. The data also suggest that the rise in medical costs is primarily attributable to the price of services, not increased utilization.

The rise in the cost of health insurance has received considerable attention by Congress and resulted in calls for more regulation. The regulation of private health insurance has traditionally been under the jurisdiction of the states. Most states have used their regulatory authority over the business of insurance to require the filing of health insurance documents containing rate information for one or more insurance market segments or plan types. With the enactment of the Patient Protection and Affordable Care Act (P.L. 111-148, PPACA) on March 23, 2010, and subsequent amendments, the federal government will assume a role in private health insurance rate reviews by providing grants to states and requiring health insurance companies to provide justifications for proposed rate increases determined to be unreasonable.

This report provides an overview of the concepts, regulation, and available public data regarding private health insurance premiums. This report will be updated to reflect relevant legislative activity and the availability of new public data.
Introduction

Health insurance premiums represent a contractually agreed upon amount to be paid for a defined set of health benefits during a defined period of time (usually a year). Premiums are typically paid in monthly installments by policyholders (individual coverage) and enrollees (group coverage). Premiums may vary for different individuals with the same health benefits package from the same insurance company. Each variation is referred to as a premium rate. Rating methodologies generally vary between health insurance market segments and may have additional state-specific variation due to differences in state rate regulations. Typically, the following methods are used by market segment:

- **Individual health insurance market.** Rates vary by age and gender and may also be underwritten, meaning that the health status assessed by the past health conditions of individual are used to set the rate according to the health risk of the applicant.

- **Small group market.** What is called a “manual rate” is first calculated estimating the costs by the age and gender of the employees, geographic location, number of employees, and the type of health insurance product. Most states also permit the manual rate to be adjusted by a health status factor.

- **Large group market.** Premium rates are determined either from an individual group’s medical claims history (referred to as “experience”) or from a blended average of manual rates calculated from the members of the group and from the group’s experience.

Health insurance premium rates are actuarial estimates of the cost of covering a risk pool of individuals under a particular health benefits package for a particular period of time. Generally, the more generous the benefits package (i.e., large, open networks of providers and low cost sharing including deductibles) the higher the premiums will be. Just as premiums must be adequate to pay for expected health care use, they also must be sufficient to compensate insurance carriers for taking on the financial risk associated with providing coverage.

---

1 The three private health insurance market segments are individual, small group, and large group. They are defined at §2791(e) of the Public Health Service Act (PHSA). The term “individual market” means health insurance coverage offered to individuals (and potentially their dependents) that is not in connection with a group health plan. The determination of whether an employer is large or small depends on its average employment level for the year. Prior to PPACA, the PHSA defined a small group in terms of 2-50 employees, and a large group in terms of 51 or more employees. Section 1304(b) of PPACA amended these definitions so that a small employer is one with 1-100 employees and a large employer has 101 or more employees. However, section 1304(b)(3) of PPACA allows states to continue to define an employer with up to 50 employees as a “small employer” until 2016.

2 The term “insurance product type” refers to substantive differences in plan design (e.g., no deductible versus a high deductible) that would reasonably be expected to affect the utilization of medical care.

4 Health insurance actuaries apply mathematical expertise, statistical knowledge, economic and financial analyses, and problem-solving skills to help health insurance companies evaluate ways to manage risk. For more information on actuarial science, see American Academy of Actuaries, “Becoming an actuary,” 2010, available at http://www.actuary.org/becoming.asp.
The final premium rate calculation often is adjusted to reflect several other factors, such as making up for a previous financial loss and providing excess capital to manage various risks generally regulated under state solvency standards. State regulators have adopted solvency standards to protect consumers by requiring insurance companies to keep certain reserves of capital to protect against asset risks, underwriting or insurance risk, and business risks. Without this required safety net of reserved cash, a health insurance company could go bankrupt if it experiences unforeseen losses, thus resulting in its consumers being placed at full financial risk for their medical claims.

Data from the Bureau of Labor Statistics' (BLS's) Producer Price Index (PPI) for health insurance companies indicates that the year-over-year percentage increase by month in private health insurance premiums has averaged around 4.4% between 2004 and 2010, but has accelerated since 2009, ranging from 4.8%-5.5% (Figure 1). This may not seem like a large amount, but there are four relevant contextual factors to take into consideration. First, increases can be much higher in the individual and small group markets where the smaller risk pools can result in distortions in the average health care costs covered by premiums, due to outlier policyholders or members. In other words, if there are only a few healthy persons to help pay for a sick person, the premiums (all else being equal) will be higher than if that sick person was in a larger risk pool with many healthy persons. Second, in the employer group market, the out-of-pocket cost of premiums for individuals and families has been increasing even more because employer subsidies have been trending down. The employer and workers shares vary according to coverage tier: self-only, employee-plus-one, and family. However, in the past few years employers have shifted incrementally more of that cost to workers. For example, the average worker share of the total premium for group coverage was 19.9% in 2001 and grew to 23.3% by 2008 (Table 1). Third, as premiums have gone up, the value of the coverage has gone down in terms of higher cost sharing and deductibles (see the Appendix). Fourth, both per capita and family incomes have decreased about 2% between 2004 and 2010. As a result, incomes are not keeping up with premium increases, and a greater proportion of incomes are being consumed by health insurance premiums.

This growth of health insurance premiums and the out-of-pocket costs for individuals and families has been the focus of considerable congressional attention. Using available public data,

---

5 The term "asset risk" means the potential for a default of principal and interest or loss in fair value of assets such as bonds, loans, real estate, and stock. The term "underwriting or insurance risk" refers to the risk that medical expenses will exceed the premiums collected. The term "business risk" refers to the variety of general operational risks to the insurance company such as unexpected increases in labor costs and exposure to litigation. For a general overview of solvency standards, see National Association of Insurance Commissioners, "Risk-Based Capital General Overview," July 2009, available at http://www.naic.org/documents/committees_e_capad_RBCoverview.pdf.

6 In the case of employer group coverage, the PPI survey takes into account the amount paid by the employer. Year-over-year refers to a comparison of prices to the same time period in the previous year, such as a month or quarter. For example, comparing the percent change in prices in January 2009 to the prices in January 2010. This type of analysis is appropriate for health insurance because coverage typically begins on the first of each month and the duration of the coverage is typically a year.

this report explores the potential drivers of the growth trend in health insurance premiums. Specifically, this report analyzes the four broad components of health insurance premiums: medical claims, administrative costs, profit, and miscellaneous factors often referred to as the underwriting cycle. Finally, the report discusses state requirements to review health insurance rates, and relevant rate regulation provisions under federal health reform.

Figure 1. Year-Over-Year Percentage Change in Premiums for January and Average for All Other Months, 2004-2010

![Figure 1](image-url)

Notes: The year-over-year percentage change is isolated for January because most group plans are sold for 12-month durations beginning on January 1 of each year. Individual market health insurance products are sold monthly and usually for a 12-month duration. Thus, the average monthly year-over-year % change for February through December is presented. The indexes for this industry measure the change in the total premium (employee and employer contribution) paid to the insurer plus the return on the invested portion of the premium. For more information on the survey methodology, see U.S. Department of Labor, Bureau of Labor Statistics (BLS), "Producer Price Index for the Direct Health and Medical Insurance Carriers Industry – NAICS 524114," September 2005, available at http://www.bls.gov/ppi/ppeimedicallinsurance.htm.

(...continued)

10 The health insurance company financial data that could most directly demonstrate specific plan level medical and administrative expenses that drive premiums generally is proprietary and confidential. Regulatory filings such as those with the Securities and Exchange Commission or the state insurance commissioners are reported at the legal entity or parent organization level. In other words, aggregate financial data for an entire company or the company within a state do not reflect the variations in both premiums and costs observed in each of the multiple plans offered by a single organization.

**Notes:** These shares are based on nominal premium amounts. Group premiums include coverage offered by private firms and state and local governments. MEPS employer group health insurance premium data were unavailable for 2007.

### Drivers of Premium Increases

In general, the premiums charged by health insurance companies represent the estimated amount that would be required to cover initially three major components: (1) the expected cost of the health benefits covered, (2) the administrative costs of operating the coverage, and (3) a profit margin consistent with the strategic business goals of the company.\(^{11}\) The fourth and final component to the premium calculation involves adjustments upward or downward to reflect several miscellaneous factors, such as responding to prior gains or losses, strategically responding to competitors (i.e., pricing lower to gain market share), hedging against uncertainty risks created by a changing regulatory environment, and other factors often collectively described as the underwriting cycle.

### Health Benefits Expenses

Health benefits expenses equal the aggregate of the unit prices of the health services times the utilization of health services (e.g., hospital visits) or health items, such as prescription drugs.

\(^{11}\) Cost is the product of the price of health benefits and the utilization of those benefits. Profit margin is a financial ratio used to assess the profitability of a firm. It equals revenue minus expenses divided by revenue. Different organizations have different strategic business goals that can also change over time. Maximizing profit may not always be the goal for a given time period. For example, a for-profit company may accept lower profit margins for a period of time in order to gain more market share by offering a better price compared to the firm’s competitors. While non-profit insurers do not seek to generate profit in the conventional sense, they have an incentive to reduce expenses in order to invest retained earnings back into the organization for capital expenditures such as purchasing additional information technology, expanding customer service operations, or other administrative activities.
Health benefits expenses represent the largest component of premiums. According to the aggregate health insurance industry statements of revenue and expenses submitted to the National Association of Insurance Commissioners (NAIC) in 2008, health benefits represented about 88% of premiums.  

Health benefits expenses on a per member per month (PMPM) basis have trended upwards between 2002 and 2009 in aggregate for the health insurance industry, as illustrated in Figure 2. The term "member month" refers to each month of coverage for an enrollee or policyholder, thus a member for a full year would have 12 member months. PMPM calculations are often used for health insurance financial statistics because enrollments and premium payments are generally made on a monthly basis. The annual percentage increase in total health benefits expenses, typically referred to as the medical trend, has generally been over 7% per year, but the rate of growth decelerated to 4.9% between 2008 and 2009, likely due to the macroeconomic conditions for consumers during this period. The medical trend of a particular plan or policy can vary substantially based on such factors as the relative health status of the enrollees and policyholders, differences in coverage policy, differences in the use of managed care techniques, geographic differences, use of restrictive versus open provider networks, and various organizational factors, such as being for-profit or non-profit.

Figure 2. Per Member Per Month (PMPM) and Annual Percentage Increases in Health Benefits Expenses for the Health Insurance Industry, 2002-2009
Unit Prices

The unit price of health services and prescription drugs is determined through a contract negotiation process between health insurance companies, health providers, medical device companies, and drug manufacturers or distributors. There is evidence of considerable geographic variation in provider, but not prescription drug pricing.\textsuperscript{13} The Government Accountability Office (GAO) has reported that for private insurers with Preferred Provider Organizations (PPOs) in the Federal Employee Health Benefits Program (FEHBP), hospital prices varied by 259% and physician prices varied by about 100% across metropolitan areas.\textsuperscript{14} GAO attributed the variation in prices paid by insurers to regional differences in provider bargaining power. Similarly, the Center for Studying Health System Change has found evidence that providers may have a negotiating advantage over insurers in some markets. In one study conducted in 2002-2003, health care providers were found to have dominant negotiating power that afforded them the opportunity to secure significant payment rate increases.\textsuperscript{15} Another study in six California markets between October and December 2008 found that physician group practice integration with hospital systems, hospital mergers, the desire for broad provider choice, growing physician shortages, and a regulatory environment that favors providers all contributed to a price negotiation advantage for some providers.\textsuperscript{16}

The power of providers in negotiating higher unit prices has been recognized by some state insurance commissioners that perform premium rate reviews. For example, in the reformed Massachusetts market, the Division of Insurance approved (on appeal) a premium rate increase for Fallon Community Health Plan after finding that, among other things, "individuals and employer groups demand that Fallon provide options that include access to every doctor and hospital, including local providers, as well as access to larger tertiary systems."\textsuperscript{17} The Massachusetts Division of Insurance Appeals Board concluded that "[m]arketplace realities mean that Fallon sometimes has no choice but to contract with higher cost providers." Similarly, an investigation by the Office of the Massachusetts Attorney General concluded that large providers with brand-name recognition have considerable leverage over all health insurance companies when negotiating prices, and that price increases have accounted for the majority of the medical trend in Massachusetts.\textsuperscript{18}

\textsuperscript{13} Drug prices generally involve national-level negotiations between pharmacy benefit managers working on behalf of health insurers and drug manufacturers or distributors. By limiting the number of negotiating entities and make the negotiations more national in scope, the geographic variation of prescription drug prices is limited. By contrast, the pricing of health services involves health insurance companies negotiating at the local level with thousands of individual providers, provider groups, agencies, long-term care facilities, and hospitals.

\textsuperscript{15} J. White, R. Hurley and B. Strunk, "Getting Along or Going Along?" Center for Studying Health System Change, January 2004.

\textsuperscript{17} Fallon Community Health Plan v. Division of Insurance, Docket No. R2010-07, August 6, 2010.

Health care services and items in the United States generally lack unit price transparency because they are considered proprietary contractual negotiations between payers and providers. Moreover, standard measures of producer price inflation, such as the PPI, are inappropriate to examine the unit price inflation among privately insured persons because they include prices paid by consumers that are uninsured or are in government programs (e.g., Medicare and Medicaid). However, one survey by Segal Consulting found that the annual price inflation for hospitals has increased from 7.7% to 8.5% between 2008 and 2011 (2011 estimates from insurers are based on provider-contracted rates set before the coverage year begins). Annual price inflation decreased from 4.0% to 3.1% for physicians during the same period, and prescription drug price inflation stayed around 6.5% between 2008 and 2010 (drug price data were not available for 2011).

Health Service Utilization

The conventional wisdom has been that the aging of the American population is the primary or major driver of increased demand for health services and prescriptions drugs experienced by health insurers. On its face, this seems logical given that the elderly have the highest utilization of health care. However, the overall age distribution of the population actually shifts very slowly over time. Indeed, the median age of the U.S. population is projected to increase just 1.8 years, from 36.9 in 2010 to 38.7 in 2030. In terms of risk based on age, private health insurance benefits from the Medicare program, which assumes the liability of coverage for most persons over the age of 65. Ultimately, what matters for the insurer is not merely the general population trends, but the specific age distribution of the risk pool being insured. Moreover, studies have found that while aging does have an impact on rising health care utilization, other factors such as advances in costly medical technology and medical practice patterns drive demand more.

Without countervailing regulations, such as minimum loss ratios, health insurance companies have a financial incentive to restrain utilization. Generally, the less they pay in health benefits, the higher their profits will be. Health insurance companies can implement a number of different management techniques or limitations on coverage to restrain health care utilization. Traditional utilization management techniques include utilization review, case management, and physician gatekeeping. Insurers may also attempt to limit the use of high-priced or high-utilizing health care services by using techniques such as prior authorization or other prior authorization programs. These programs are designed to ensure that health care services are appropriate and necessary to the patient. Without such programs, health insurance companies may be liable for paying for services that are not medically necessary or appropriate.

21 U. Reinhardt, "Does The Aging Of The Population Really Drive The Demand For Health Care?" Health Affairs, 2003, vol. 22, no. 6 (hereafter cited as "Aging").
24 See B. Strunk, P. Ginsburg, and M. Banker, "The Effect Of Population Aging On Future Hospital Demand," Health Affairs, Web Exclusive, vol. 25, no. 3; and "Aging."
25 Utilization review includes prospective reviews, often called prior authorization (PA), that attempt to constrain health care costs by reducing unnecessary or inappropriate medical care before the care takes place. For example, a plan might conduct a preadmission review to certify the need for a hospitalization and assign an initial length of stay. Case management includes care coordination and the use of evidenced based medicine to ensure the highest probability of positive outcomes in a cost effective manner. For example, for a member with heart disease, a plan might coordinate between a primary care physician and a cardiologist to ensure that there is no duplication in services, such as (continued...
care providers through their network contracting process. Since the cost sharing is lower for in-network providers, the plan can financially incentivize its members to use lower-cost providers by contracting only with them. Finally, insurers may choose to not cover a particular procedure, use of a technology, or prescription drug.

Generally, utilization management techniques and restrictive benefits became prevalent in the late 1980s, but their use has been waning since the mid-1990s, in the face of strong consumer resistance to anything other than case management, where coordination between providers and evidence based medicine are used to improve outcomes. For example, in the employer group market enrollment in health maintenance organizations (HMOs), the most restrictive type of plan, dropped from 31% in 1996 to 19% in 2010, while less restrictive preferred provider organization (PPO)/point of service (POS) plans increased from 42% to 66%. In the individual (non-group) market, 2009 data from America’s Health Insurance Plans (AHIP) indicate that 82.8% of members with single coverage and 72.9% with family coverage elect a PPO/POS plan, with less than 2% electing HMO or similarly restrictive plans.

As the market has moved away from health insurance products with strong utilization management programs and limited provider networks, utilization of health services and prescription drugs has consistently increased every year, as measured in population-based surveys and gross sales figures. However, these trends in gross measures of service utilization could be explained by increases in the total population or the number of persons that are insured. In other words, per insured member service utilization may not be increasing. However, studies where researchers have had access to claims data and provider payment rates have found that most of the increase in health benefits expenditures, other than certain outpatient procedures and prescription drugs, are attributable to increases in unit prices not to increases in the utilization per insured member.
Administrative Costs

In addition to paying for medical claims, premiums are expected to cover the operational costs of the insurance company. Health insurance companies generally are complex organizations requiring specialized human resources and information technology to perform the functions of developing, marketing, and operating a health plan or insurance policy. Table 2 provides a summary review of administrative functions in health insurance plans.

Insurance company-reported PMPM administrative costs in regulatory filings indicate a relatively stable trend, with average costs per company increasing only about $3 PMPM from 2007 to 2009 (Figure 4). Variation between companies was observed, with specialty companies (e.g., dental only, behavioral health) generally reporting below $10 of PMPM in administrative costs, and companies with an emphasis on non-group insurance often reporting more than $100 PMPM in administrative costs. Administrative expenses have been found to vary by market segment, with non-group insurance costing the highest and large group the lowest. This is attributable to factors such as enrollment size (non-group enrollment typically is smaller, thus there are fewer persons to spread the costs around to). While group plans can sell to a few individuals (usually an employer's human resources department), non-group insurance must be sold one-by-one to each person, thus increase marketing and sales costs.

Source: HighlineData's Insurance Analyst Pro database of health insurer regulatory filings.

Notes: Includes 673 different legal entities reporting in all three years with at least 1,000 enrollees. Legal entities with less than 1,000 enrollees were excluded because they typically were startup companies with outlier cost structures. A legal entity refers to an incorporated business licensed to sell insurance. Many large corporate parent organization have multiple legal entities. For example, Aetna has 16 different companies within this dataset.

A company with multiple products generally prices each product separately. For example, Ford Motor Company does not have one price for each of its vehicles. It charges separate prices for the Explorer, Taurus, Fusion Hybrid, and its other models. Similarly, premium rates are calculated at the health insurance product level (i.e., the health plan or policy that a person, family, or employer purchases), not at the company or corporate parent levels (i.e., the corporate entity that sells the insurance product). 34 So additional variation might be observed within each company if product level data were available.

These data are also limited by the fact that many health insurance companies have multiple non-insurance businesses. For example, the United Health Group (UHG) includes the information technology and consulting firm Ingenix and the pharmacy benefits manager (PBM) Prescription Solutions in addition to its health insurance benefits business segment. 35 The inherent complexity of a large conglomerate may create unique challenges for accurate cost accounting down to the individual plans and insurance products sold within the organization. These challenges could create barriers to fair and comprehensive regulation of administrative costs across different types

34 For example, United Health Group is the corporate parent of Golden Rule Insurance Company, which sells several different individual insurance policy products each with their own premium rate calculations. For more information, see Golden Rule Insurance Company, 'UnitedHealthOneSM Personal Health Insurance Plans for Individuals and Families,' 2010, available at https://www.uhome.com/FILEHandler.ashx?FileName=38960LCS-G201008.pdf.

of health insurance companies (i.e., small local and regional non-profit insurers versus large national investor-owned, for-profit insurers).

There is no consensus benchmark for what is an appropriate amount of administrative costs. Nevertheless, several industry executives of the publicly traded for-profit firms believe that administrative costs can come down as evidenced in the summary of recent earnings conference calls provided in Table 3.

</tbody>
</table>

Note: The term “S,G,&A” means selling, general, and administrative and is reported on the income statement, it is the sum of all direct and indirect selling expenses and all general and administrative expenses of a company.

Health Insurance Company Profits

There is substantial variation in health insurance company profits due to differences in the size of the companies and their willingness to aggressively manage health costs. Wellpoint, a large (33.67 million members) investor-owned, national for-profit company, emphasizes reduced costs
and value for its investors. In 2009, Wellpoint had $4.75 billion in net income (profits after taxes). By contrast, Blue Cross Blue Shield of Rhode Island (BCBS-RI), a mid-sized (447,000 members) non-profit company operating in one state with a community mission, took nearly a $99.9 million loss in 2009. Weiss Ratings found that the average profit margin (net income divided by revenues) in 2009 of the 543 health insurers studied was 2.6%. Profit margins were higher (9.9% vs. the 2.6% average) for large companies ($1 billion or more in assets) with low medical costs in relation to premiums (a medical loss ratio below 85%), as illustrated by Figure 4. Because of the membership scale associated with more profitable health insurers, it is unlikely that reductions in net income would have a substantive impact on premiums for individual members. For example, if Wellpoint’s entire 2009 net income of $4.75 billion were rebated back to its 2009 members, it would result in a monthly premium credit of $11.75.

**Figure 4. Health Insurance Company Profit Margins, 2009**

Notes: Large companies are defined as those with $1 billion or more in assets. A medical loss ratio (MLR) is the percentage of premium revenues spent on medical claims. It is a common metric assessing the ability of a health insurance company to manage health costs. The Patient Protection and Affordable Care Act (P.L. 111-148, PPACA) establishes 85% as a minimum MLR for large group plans.

38 Weiss Ratings, “Health care reform could cost health insurers far more than expected,” August 2010.
39 A medical loss ratio (MLR) is the percentage of premium revenues spent on medical claims. It is a common metric assessing the ability of a health insurance company to manage health costs. The Patient Protection and Affordable Care Act (P.L. 111-148, PPACA) establishes 85% as a minimum MLR for large group plans.
40 Net income in 2009 of $4,745,900,000 divided by 2009 membership of 33,670,000 equals $140.95 (rounded) divided by 12 months equals $11.75 (rounded) per member per month.
The Underwriting Cycle

The health insurance underwriting cycle refers to the tendency for health insurance premiums and insurer profitability to cycle over certain time intervals. (This is a different, but related, concept to medical underwriting, which is the process by which an insurer estimates the insurance risks and potential medical costs associated with an applicant for insurance based on characteristics of that applicant.) Upturns and downturns in the underwriting cycle are basically the outcome of adjustments to premiums that reflect past experience, expectations of future losses, business strategy, attempts to mitigate possible impacts of regulatory changes, and the changing consumer demands of the members and policyholders (e.g., demand for large and open provider networks). For example, a health insurance company may charge premiums above the anticipated amount necessary for the current plan year’s costs because the insurer lost money on the product in previous years. This will start an up cycle in profitability until it prices itself out of the competitive market, thus forcing a cut in premiums and ultimately profit margins. Alternatively, the insurer may have a business strategy to obtain as much market share as possible. To do this, the insurer reduces premiums below competitors, even if it reduces profit margins or results in a temporary loss. Once the insurer commands the desired market share, it increases premiums to achieve the desired maximum profit margin that the market will allow.

Adding to the complexity, the insurance company often may attempt to subsidize one policy or plan with profits from another. To illustrate this, Table 4 provides an example of one insurance carrier’s actual premium and medical loss experience in one state between 2007 and 2009. The table was abstracted from a premium rate increase request for 2010 for individual market blocks of business with and without maternity coverage from Anthem Blue Cross Life and Health Insurance Company (hereafter referred to as “Anthem”) submitted to the California Department of Insurance. For the years 2007 through 2009, the table presents the actual per member per month (PMPM) premiums charged, the PMPM claims experience, the medical loss ratio (the percentage of premiums spent on medical claims), the total member months, and the gain or loss on medical expenses by the maternity and non-maternity blocks of business in the individual (non-group) market. Member months are used to reflect enrollment based metrics because individuals can join or leave a plan or policy on a monthly basis. Thus, having a member for 6 months versus the full year (12 member months) would be meaningful in terms of total premiums collected and likely claims experience.

Anthem’s maternity coverage policies had an operational gain in 2007, with relatively few policyholders (in member months). However, these policies operated at a loss in 2008 and 2009 despite a higher number of policyholders. Based on this trend, Anthem projected nearly a $14.2 million loss for 2010 on the maternity block of business. What are some of the options for Anthem or any other insurance company in a situation like this? It could increase premiums in the maternity coverage policies to $320 PMPM to match expected claims costs PMPM for 2010, but that would be nearly a 74% increase from premiums in 2009. Alternatively, Anthem could eliminate the maternity coverage policies, seek out non-premium sources of revenue (e.g., investment income), aggressively implement managed care methods to reduce costs, or make up for the losses in this product with gains from another product line. The latter option is what...

---

Investment income refers to income received from investment assets (before taxes) such as bonds, stocks, mutual (continued...)
Anthem suggests in this rate filing. In other words, losses from the maternity coverage are financially cancelled out for the company by gains from the policies sold without maternity coverage.

Notes: The acronym PMPM stands for per member per month. The term "medical loss ratio" means the percentage of premiums spent on medical claims. The term "member month" refers to each month of coverage for an enrollee or policyholder, thus a member for a full year would have 12 member months. Gain/Loss on medical expenses refers to the gain or loss experienced from paying medical claims out of premium revenues. This calculation does not involve other financial factors such as administrative costs.

Review of Health Insurance Rates

The regulation of private health insurance has traditionally been under the jurisdiction of the states. For most states have used their regulatory authority over the business of insurance to require the filing of health insurance documents containing rate information for one or more market segments or plan types. With the enactment of the Patient Protection and Affordable Care Act (P.L. 111-148, PPACA) on March 23, 2010, the federal government will assume a role in private

(...continued)

funds, loans and other investments (less related expenses).

For additional information about state and federal regulation of private health insurance, see CRS Report RL32237, Health Insurance: A Primer, by Bernadette Fernandez.
health insurance rate reviews by providing grant funding to states for rate reviews and requiring, among other things, that plans and insurers justify certain rate increases.

State Rate Filing and Reviews

As the primary regulators of health insurance, states oversee many aspects of the industry concerning the insurance products offered in the market and the entities that sell insurance. One fundamental area in which states exercise regulatory authority is through the imposition of rate and form filing requirements. "Form" refers to the language in the insurance contract and typically is required when a new plan is offered in the market (or changes are made to that plan). "Rate" refers to the price of a unit of insurance. Rates are filed with the initial form and usually must be filed each time an insurance carrier proposes to change rates for a plan (or if changes in the form filing affect rates).

Not all states actually conduct rate reviews. For those states that do, the purpose is threefold: to ensure that rates are sufficient (to guard against insolvency), but not too high (must be actuarially justified), nor unfairly discriminatory (variation in rates must be based on differences in expected claims). There is substantive variation in state regulation of health insurance rates. Some states collect rates for informational purposes only or as part of their form filing requirements. One state has "use and file," which means the filing becomes effective when used, though the insurer is required to file rates with the state. A number of states have "file and use," where the insurer must file rates with the state, which become effective either immediately or on a date specified in the filing. Under either of these scenarios, the state may disapprove a rate filing if it does not meet a certain compliance standard, such as a minimum anticipated medical loss ratio. Over half of states have "prior approval" requirements, where insurance companies must file proposed rate changes and the state has the authority to approve, disapprove or modify the request. However, prior approval authority typically also includes a deeming period; if the state does not take any action and the deeming period elapses, the filing become effective. Under such a scenario, prior approval requirements may effectively work just like file and use. (A list of rate filing requirements by state is provided in Table 5.)

In any given state, the rate may vary according to the rating factors allowed by the state. For example, rates in the individual market may be prohibited from varying based on health factors, but may be allowed to vary based on age, sex, or other risk factors. The permissible variation in rates establishes theoretical parameters. The actual premiums charged for a set of insurance policies may not span the spectrum of allowed rates; it depends on who applies and accepts coverage.

Notes: I – Individual Market. S – Small Group Market. L – Large Group Market. “Form” refers to the language in the insurance contract and typically is required when a new plan is offered in the market (or changes are made to that plan). Rates are filed with the initial form and usually must be filed each time an insurance carrier proposes to change rates for a plan, but the rates are generally not reviewed. “Informational” refers to rate filing requirements where the data is collected and kept by the state, but is not reviewed. “Use and file” means the filing becomes effective when used, though the insurer is required to file rates with the state, which may be reviewed retrospectively. “File and use” refers to requirements where the insurer must file rates with the state, which become effective either immediately or on a date specified in the filing. File and use state may review the rates retrospectively after the effective date. In this case, states usually base their review on claims and financial data submitted by the insurer to examine if the rates were appropriate for the actual claims experience. “Prior approval” refers to requirements where insurers must file rates with the state, and the state has the authority to approve the filing or disapprove it before the effective date.

a. If insurer does not meet medical loss ratio standards, the rate filing is subjected to prior approval.

b. Insurers must still provide actuarial certification.

c. State imposes medical loss ratio requirements.

d. On May 9, 2010, then and now former New York Governor David A. Paterson signed into law Governor’s Program Bill No. 278, which reinstates the New York State Insurance Department’s former authority to review and approve health insurance premium increases before they take effect. The law applies to all rate increases taking effect on or after October 1, 2010.
Limits on publicly accessible rate review data make comprehensive uniform comparisons between states elusive. Only 13 states have public Internet access to rate filings or summary statistics on rates. Moreover, there is considerable variation in how states with rate review regulations make their information public. For example, the Maine Bureau of Insurance posts rate filings for only or insurers that are called to present their requested increase at a public hearing, whereas the Oregon Insurance Division publicly provides a list of average rate increase requests and approvals by regulated entities and provides access to individual rate filings and approvals.

In terms of approvals of rate increases, there is considerable variation between states. For example, Oregon approved 68.3% of recent requested rate increases, whereas Massachusetts approved only 14.2%. These differences are likely due to both differences in regulatory standards, geographic variation in health insurance markets, health services utilization patterns, and health provider payment rates. The available public information suggests that states approve, adjust, or reject requests for rate increases primarily based on an analysis of cost trends in relation to rate increases approved in prior years, and that the approved rates can be double-digit percentage increases from the previous year. To illustrate, consider the case of Regence Blue Cross Blue Shield of Oregon, which requested an average annual increase of 26.4% for its individual health plans but was approved for a 17.3% increase effective January 1, 2010. Despite medical costs increasing 12.6% from the prior year and a financial loss of 9.7% ($15,476,565) on these policies over the period of May 1, 2008, through April 30, 2009, Oregon decided that the lower rate increase was appropriate because Regence had received an approved average rate increase of 26.5% on the same policies for the previous year. By contrast, Health Net Health Plan of Oregon’s individual health plans requested and received a significant average annual rate increase of 22.8% effective on October 1, 2009. Oregon believed that the increase was justified because Health Net lost money on these policies each year between 2005 and 2008.

---

46 Those states are CO, CT, FL, IL, ME, NE, NJ, NC, OH, OR, PA, RI, and WI. See “NAIC Response.”
51 Ibid.
(in aggregate $1,436,505) and it had received average rate increases less than the average increase in medical costs for four of the past five years.  

**Federal Reforms Affecting Premiums**

The Patient Protection and Affordable Care Act (P.L. 111-148, PPACA) was signed into law on March 23, 2010, and has since been amended. PPACA, as amended, has provisions designed to bring down the cost of premiums through transparency in premium increases and minimum medical loss ratio requirements, but it does not go as far as to include a formal prior approval process for proposed rate increases. Specifically, the Health and Human Services (HHS) Secretary must, in conjunction with the states, establish a process for the annual review of unreasonable increases in premiums for health insurance coverage beginning in the 2010 plan year.  

The term “unreasonable” is not defined by the law and presents a challenge in preventing unintended consequences such as providing additional market leverage to large, national for-profit companies over small, local non-profit insurers. The complexity of making such a determination generally requires analysis of multiple factors by actuaries and accountants. Such a review generally does not lend itself to the use of simplistic benchmarks such as merely prohibiting double-digit percentage rate increases. As the National Association of Insurance Commissioners (NAIC) notes:

> The process should identify “potentially unreasonable” increases, with further review by states and/or the HHS Secretary to determine any mitigating or exacerbating factors and decide whether the increase is actually unreasonable. Any increase that is necessary to avoid a future financial loss on the block of business is usually considered reasonable, unless there are compelling reasons to determine that it is unreasonable. Rates that produce a financial loss can affect consumers by impairing the financial soundness of the insurer, reducing the insurer’s incentive to provide good customer service, reducing the insurer’s incentive to continue providing coverage and shifting costs to other blocks of business.

Health insurance issuers will be required to submit to the HHS Secretary, and the relevant state, a justification for an unreasonable premium increase prior to implementation of the premium, and the HHS Secretary will publicly disclose the information. The justification requirement does not provide the HHS Secretary with the authority to prohibit the plan from implementing the rate increase. In other words, this is a “sunshine” provision designed to publicly expose premium

33 Ibid.

55 Wall Street analysts at Credit Suisse stated that they “believe winners and losers will emerge in managed care. Winners will have access to public-equity capital and invest strategically to offset margin compression by taking market share from 1,200 insurers that may not survive.” See Investors’ Soapbox PM, “Healthy Picks in Managed Care: Credit Suisse likes UnitedHealth Group, WellPoint, Coventry and Humana,” August 17, 2010.

56 See “NAIC Response.”

57 §1003 PPACA: §2794(a)(2) PHSA. Per §2791(b)(2) PHSA, the term “health insurance issuer” means an insurance company, insurance service, or insurance organization (including a health maintenance organization) that is licensed to engage in the business of insurance in a state and that is subject to state law which regulates insurance within the meaning of section 514(b)(2) of the Employee Retirement Income Security Act of 1974. The term does not include a group health plan, which includes self-insured plans. The term “self insured” refers to group benefits plans (usually sponsored by employers) that take on the insurance risk, rather than contracting with an insurance company to take on the insurance risk (fully insured plans).
increases determined to be unreasonable. On December 23, 2010, the HHS Secretary issued a notice of proposed rulemaking for the PPACA rate review provision, with a comment period ending February 22, 2011. The HHS Secretary proposes that when the average increase, alone or in combination with prior increases in the preceding 12-month period, is 10% or more then the rates will be subject to more review to determine if they are unreasonable. The proposed regulation stipulates that HHS would be adopting a state’s determination of what an unreasonable rate increase is if the state has an effective rate review program. The proposed regulation specifies that a state’s rate review program would be considered effective if the state has the legal authority to obtain the data and documentation necessary to conduct an effective examination. Further, the state must have the ability to review the data and documentation submitted in support of the proposed rate increases, including an examination of the reasonableness of the actuarial assumptions used by the insurer, the validity of historical data underlying the assumptions, and the insurer’s accuracy with past projections. If the state does not have an effective rate review program, the Secretary proposes that HHS would conduct the review. HHS would determine that a rate increase is unreasonable if:

- **The rate increase is excessive.** The premium charged would be considered excessive if it is unreasonably high in relation to the benefits provided. HHS would consider if the rate increase results in a projected future loss ratio below the medical loss ratio standard required under section 2718 of the PHSA. HHS would also consider if any of the assumptions on which the rate increase is based are not supported by evidence or do not support an increase of the magnitude being proposed.

- **The rate increase is unjustified.** Health insurance issuers would be required to provide certain data and documentation to HHS supporting the proposed rate increase. If the data and documentation submitted are incomplete or inadequate then the proposed increase would be determined to be unreasonable.

- **The rate increase is unfairly discriminatory.** A proposed rate increase would be unfairly discriminatory if it results in premium differences within similar risk categories that are not permissible under applicable state law or, if no state law applies, do not reasonably correspond to differences in expected costs.

To support the premium rate review process, PPACA requires the HHS Secretary to carry out a program of grants to the states. These grants have an appropriation of $250 million for states to use during the five-year period beginning with FY2010. On August 16, 2010, the HHS Secretary announced the first award of $46 million to the 45 states and the District of Columbia (DC) that had applied for grants. Each approved grantee will receive $1 million. While there was some variation in the grant applications, all 46 approved grantees stated that they will require health insurance companies to report more extensive and standardized information to better evaluate proposed premium rate increases and 43 of the 46 grantees said they would make the

59 A “risk category” is a classification of a group of insured individuals who share a common characteristics, such as age or geographic location, and are covered under a single insurance product.
60 §1003 PPACA; §2794(c) PHSA.
new information publicly available in a consumer-friendly format. Several states (21 and DC) indicated that they would use the grant money to help expand the scope of their current premium rate review, such as moving to a prior approval process for proposed rate increases. Another 15 states indicated that they were seeking, and would need to obtain, additional authority under state law before they could proceed with expanding the scope of their premium rate reviews.

In addition, PPACA enables and supports states' creation by 2014 of "American Health Benefit Exchanges" (hereafter referred to as exchanges), which are intended to be regulated marketplaces for the purchase of health insurance. The HHS Secretary, in conjunction with the states, will monitor premium increases of health insurance coverage offered through and outside of the exchanges. States will make recommendations to the exchange in their state about whether a health insurance issuer should be excluded from participation in the exchange based on a pattern of excessive or unjustified premium increases. The terms "pattern" and "practice" are not defined by the law. PPACA also establishes that each exchange has the authority to determine if making a certain health plan available "is in the interests of qualified individuals and qualified employers" participating in such an exchange, but the exchange may not exclude a health plan through the imposition of premium price controls.

PPACA will also require a health insurance issuer offering group or individual health insurance coverage (including a grandfathered health plan) to meet a certain minimum medical loss ratio (MLR). Minimum MLR requirements are designed to potentially restrain premium increases by limiting the proportion of premiums that can be used for administrative expenses, including profits, compared to medical expenses. Thus a plan cannot increase premiums while concurrently reducing the amount spent on health benefits. On the other hand, minimum MLR requirements may have a limited effect on restraining premium inflation if those premiums reflect increases in administrative expenses and claims costs in proportion to the requirement.

Effective for plan years beginning on or after September 23, 2010, health insurance issuers in the group and individual markets (including grandfathered health plans) are required to submit to the HHS Secretary a report concerning the ratio of incurred loss (or incurred claims) to earned premiums, typically referred to as an MLR. Beginning no later than January 1, 2011, PPACA requires a health insurance issuer offering group or individual health insurance coverage

66 §1003 PPACA: §2794(b)(1)(B) PHSA.
67 §1311(e)(1)(B) PPACA.
68 The term "grandfathered plan" refers to a health plan or health insurance coverage which had at least one enrollee on the date of PPACA enactment (March 23, 2010). For more information about grandfathered plans, see CRS Report R41166, Grandfathered Health Plans Under the Patient Protection and Affordable Care Act (PPACA), by Bernadette Fernandez.
69 This provision includes fully insured grandfathered plans.
70 §1001, as amended by §10101: §2718 PHSA. Beginning on January 1, 2014, this calculation will be based on the averages of the premiums expended on the costs for each of the previous three years for the plan. The Secretary will make these reports available to the public on the Internet site of the Department of Health and Human Services.
(including grandfathered health plans) to provide an annual rebate to each enrollee on a pro rata basis if the ratio of the amount of premium revenue expended by the issuer on clinical claims and health quality costs, after accounting for taxes, regulatory fees, risk adjustment, risk corridors, and reinsurance, is less than 85% in the large group market and 80% for the small group and individual markets.\textsuperscript{71} States are permitted to adjust the percentage for the individual market if it is determined that the application of the 80% minimum MLR would destabilize the market in the state. On December 1, 2010, the HHS Secretary promulgated regulations establishing a process whereby states may request an adjustment of the target MLR for the individual market if the evidence suggests that there is a substantive risk that a large number of individuals would lose their insurance or pay higher premiums and not have reasonable alternatives for coverage.\textsuperscript{72} HHS estimates that for insurance products that do not meet the MLR requirements in 2011, the average rebates for a person insured for the full 12 months will be between $150-$164 for individual policies, $216-$587 in small group plans, and $127-$312 in large group plans.\textsuperscript{73} But for insurance products meeting the MLR standards, it is unclear what impact these standards will have, if at all, on the premium rates.

\textsuperscript{71} §1001, as amended by §10101(f) of PPACA: §2718 PHSA. Appendix. Private Health Insurance Cost-Sharing

Other Insurance Costs Not Included in the Premium

Health insurance premiums generally represent only a part of the insured individual or family’s costs incurred under a given benefits plan for health services and prescription drugs. While enrollees and policyholders pay premiums irrespective of health service use, they typically are responsible for cost sharing in the form of deductibles, flat dollar co-payments, and/or percentage co-insurance only when services are used. Increased cost sharing has been viewed by some as a method of shifting costs to those who are utilizing the services, thus limiting the shared risk and constraining premium growth. On the other hand, increasing cost-sharing reduces the value of the coverage at the same time premiums are going up. Essentially individuals and families end up paying more for less, due to exposure to higher out-of-pocket costs.

Similar to the observed increases in premiums, cost-sharing expenses have been increasing. Thus, some individuals may be able to afford purchasing the insurance, but not be able to afford the cost of utilizing health care services despite being insured. From a consumer perspective, deductibles have the most impact because coverage does not start until the enrollee spends more than the deductible amount. As illustrated in Figure A-I, deductibles have been increasing across plan types in both the group and non-group markets. Comprehensive data on other benefit designs such as drug co-payments and hospital co-insurance are not publicly available. However, the Milliman Medical Index estimates that for a typical family of four with private employer group coverage, out-of-pocket cost sharing has increased between 5.4% and 10.5% annually between 2006 and 2010.

The term “deductible” means a fixed dollar amount during the benefit period that an insured person pays before the insurer starts to make payments for covered medical services. In other words, there is 100% cost sharing until the deductible amount has been reached. (Though some plans may not apply certain services to the deductible requirement, such as well-child visits, to not discourage the use of such services.) The term “flat dollar co-payments” means medical cost sharing in a health insurance plan that requires an insured person to pay a fixed dollar amount when a medical service is received. The insurer is responsible for the rest of the reimbursement. The term “percentage co-insurance” means of medical cost sharing in a health insurance plan that requires an insured person to pay a stated percentage of medical expenses after the deductible amount was paid. Thus is the co-insurance is 10% and the medical service is $100 then the member or policyholder would pay $10.

Figure A-1. Average Deductibles, by Health Insurance Plan Type, CY2007-2009

Notes: CY means calendar year. HMO means a health maintenance organization. PPO means a preferred provider plan. POS means a point of sale plan. HDHP means high deductible health plan.
